

# Security Shutter Solution

The security roller shutter system was developed by Hand Built to fulfil a need for a secure cabinet within the retail market. It was initially used by the tobacco industry to protect an expensive commodity that is a common target by criminals.

Versions of our security shutters have been used in the retail tobacco field since November 2000, with in excess of 20,000 units being installed. Over a 14 year period there have been many break-in attempts with less than 10 being successful due to the long period required to access the units.

The security shutter system has been designed such that when pressure is applied to the shutter, the ends tighten within the side tracks, making it more difficult to access. The more pressure applied when trying to force the shutter, the more secure the unit is.

The security shutter system is constructed from a combination of materials. The side tracks are formed from an extruded aluminium section. The shutter curtain itself uses an extruded closed aluminium section with no seams. Nylon end caps are fitted to the ends of each slat and lock into the side tracks. The locking mechanism uses folded steel rails. A very heavy duty padlock is used to secure the sliding lock mechanism.

The timber cabinet and security roller shutter system can be finished to match the majority of décor requirements.

A range of sizes are available while the internal cabinet space can be tailored to suit the customers requirements (eg. Adjustable slat wall shelving).

Hand Built can provide the timber cabinets and security roller shutter system in kit or assembled form, depending on order quantities and customer requirements.

The roller shutter system is highly recommended by the Police and many insurance companies for high theft and high value items in retailer outlets.
